Preventing overdiagnosis: how to stop harming the healthy

A strategy for reducing the number of unnecessary health-care services that cause more harm than good is to identify, learn from, and prevent them. But the implementation of such a strategy will require a change in the way we think about and deliver health care.

Ray Moynihan, senior research fellow, Centre for Health Economics, University of Edinburgh, UK; Alan Cassels, senior research fellow, Centre for Health Economics, University of Edinburgh, UK

Overdiagnosis of Disease

A Modern Epidemic

Editor

Overdiagnosis: when good intentions meet vested interests—an essay by John Moynihan

Overdiagnosis is a complex phenomenon that arises from a variety of factors, including the desire to do good, the desire to avoid litigation, and the desire to avoid the costs of a bad outcome. This essay explores the role of vested interests in the overdiagnosis of disease.

Ray Moynihan, senior research fellow, Centre for Health Economics, University of Edinburgh, UK

LESS IS MORE

Overdiagnosis and Overtreatment: Evaluation of What Physicians Tell Their Patients About Screening Harms

Commentary

The overdiagnosis nightmare: a time for caution Sofiane Clavier

Overdiagnosis – overtreatment

"Medical science has made such impressive progress that there is hardly a healthy human left" – Andrew Haines

The Overdiagnosis Problem

It's multifactorial - everyone involved in health care (clinicians, technicians and patients) plays a role

Or in other words - EVERY HUMAN

Overdiagnosis is not just the “lab’s” fault - but it is a MAJOR player

Clinical Practice Guidelines - also MAJOR culprits

The Media!

New Rule Grants Patients Direct Access to Lab Results

By Melinda Beck

Feb. 3, 2014 1:05 p.m. ET

Clinical laboratories must give patients access to their own lab-test results upon request, without going through the physician who ordered them, according to a new federal rule announced Monday by the Department of Health and Human Services.

PROBLEM #1

It's typically the same report that goes to health care providers

PROBLEM #2

Many health care providers don't appreciate the key nuances of "lab" tests

MY THESIS

“For much in medicine, we knowingly sell preeminent precision even though we all know in our heart of hearts we can only deliver educated estimates.

I believe most patients would be very understanding about this imprecision if we were just more open about it.”

-James McCormack, Pharm D (1959 - hopefully not soon)

“We also CAN’T be precise about the imprecision”

I am speaking in general, and do realise there are always some exceptions

I am presenting concepts

I will be providing ball-park estimates

Two Problems with Faking Precision

FALSE BELIEFS

BELIEF #1 - the good/bad thresholds are relatively black and white

BELIEF #2 -when the numbers change these changes are real

These beliefs can potentially lead to inappropriate feelings
of fear, happiness, frustration, confusion...

Both in patients AND clinicians

The Word
SIGNIFICANT

INCONCEIVABLE

“You keep using that word. I do not think that means what you think it means.”

Inigo Montoya, The Princess Bride

Reference Change Values

findings of a “significant difference” JUST means we are ruling out that the difference seen is due to chance

NOT

THAT THE MAGNITUDE OF THE DIFFERENCE SEEN IS THE ACTUAL MAGNITUDE OF THE DIFFERENCE

We believe these two results are different

can't necessarily quantify this
difference with any precision

What about multiple measurements?

Table 1. RCV using multiple estimates of the initial and new set points, expressed as a fraction of traditional RCV from two singleton measurements.

		Number of results estimating initial set point				
		1	2	3	4	5
Number of results estimating new set point	1	1.00	0.87	0.82	0.79	0.77
	2	0.87	0.71	0.65	0.61	0.59
	3	0.82	0.65	0.58	0.54	0.52
	4	0.79	0.61	0.54	0.50	0.47
	5	0.77	0.59	0.52	0.47	0.45

with 4 measurements before and 4 afterwards
(vs 1 before and 1 after)
you can lower the RCV by 50%

AACE 2017 Guidelines

AMERICAN ASSOCIATION OF CLINICAL ENDOCRINOLOGISTS AND AMERICAN COLLEGE OF ENDOCRINOLOGY GUIDELINES FOR MANAGEMENT OF DYSLIPIDEMIA AND PREVENTION OF CARDIOVASCULAR DISEASE

“Lipid status should be re-assessed 6 weeks after therapy initiation and again at 6-week intervals until the treatment goal is achieved.”

“While on stable lipid therapy, individuals should be tested at 6-to 12-month intervals”

Monitoring Cholesterol Levels: Measurement Error or True Change?

Paul P. Glasziou, MBBS, PhD; Les Irwig, MBBS, PhD; Stephane Heritier, PhD; R. John Simes, MBBS, MD; and Andrew Tonkin, MBBS, MD, for the LIPID Study Investigators

Background: Cholesterol level monitoring is a common clinical activity, but the optimal monitoring interval is unknown and practice varies.

Objective: To estimate, in patients receiving cholesterol-lowering medication, the variation in initial response to treatment, the long-term drift from initial response, and the detectability of long-term changes in on-treatment cholesterol level ("signal") given short-term, within-person variation ("noise").

Design: Analysis of cholesterol measurement data in the LIPID

of variation, 7%) to 0.60 mmol/L (23 mg/dL) (coefficient of variation, 11%), but it took almost 4 years for the long-term variation to exceed the short-term variation. This slow increase in variation and the modest increase in mean cholesterol level, about 2% per year, suggest that most of the variation in the study is due to short-term biological and analytic variability. Our calculations suggest that, for patients with levels that are 0.5 mmol/L or more (≥ 19 mg/dL) under target, monitoring is likely to detect many more false-positive results than true-positive results for at least the first 3 years after treatment has commenced.

Ann Intern Med 2008;148:656-61

VARIATION

Total chol ~ - 0.80 to 0.80 mmol/L (~30 mg/dL)

LDL chol ~ - 0.5 to 0.5 mmol/L (~20 mg/dL)

Average increase in cholesterol is 0.5-1%/year

“After initial change only measure every
3-5 years”

DOSE increases do not lead
to proportional EFFECT increases
% reduction in LDL cholesterol

LDL cholesterol - 2 mmol/L ~80mg/dL

Provinces struggle with demand for Vitamin D tests

Martin Mittelstaedt

Published on Wednesday, Jan. 06, 2010 6:56PM EST

“the most-ordered
hormone assay in the
United States”

J Clin Endocrinol Metab
2009;94:1092–3

February 3, 2014

Vitamin D Levels: Vitamin Do or Vitamin Don't

Clinical Question: In adults, what is the evidence to test serum vitamin D levels?

Bottom Line: Routine testing of vitamin D levels is unnecessary. Laboratories often report serum levels between 50 and 75–80 nmol/L as insufficient but this is not supported by consistent or reliable evidence. Additionally, large variability in the test limits interpretation of repeat measurements.

Variability in Measurement

Between lab/Assay variability

“The differences between the mean values for serum 25(OH)D between the laboratories with the highest and lowest values was 38%”

Ost Int 1999;9:394-7

“the mean relative uncertainties...were 19.4%, 16.0%, and 11.3%”

Ost Int 2009 - 9 September 2009 -Online

Within patient variability - 15-20%

“The results of our analyses do not support the view that vitamin D supplements should be given on the basis of measurements of individual 25-OH-vitamin D levels. Conversely, our results indicate that subjects classified as having a sufficient vitamin D status may be diagnosed with vitamin D insufficiency in a subsequent measurement”

Ost Int 1998 8:222–30

Variability VS Change from Treatment

800 IU raises vitamin D levels by ~ 20 nmol/L

Scand J Clin Lab Invest 2006;66:227–38

This increase is only slightly more than the within-in patient variability (15-20%) in the measurement but we also have analytic variability

*Vitamin D testing is only covered under MSP when the patient is < 19 years or the test is ordered by a specialist. All other vitamin D tests are user paid.

Now What?!!

The Problem
is
NOT Fixable,
it is
Only
KNOWABLE

Important caveats not discussed

Biological variances are typically from populations - can vary with age etc

Evidence behind the population-based reference intervals

Arbitrary thresholds in “guidelines”

One-sided vs two-sided testing

Not all lab tests are Gaussian/normally distributed

Bayesian approaches - pre-test and post-test probabilities

Point of Care Testing (POCT) is a whole other story

NIGHTMARE

of fear of change/IT/Legal - blah blah blah

Just the facts, Ma'am

Should we...

Openly explain and present lab variability - YES

Openly discuss the potentially black and white things about lab variability - ABSOLUTELY

Continue to use words like low, medium, high, significant - NO, NO, NO, NO

Use a 95% or a 90% or an 85% significance threshold - UNKNOWABLE

Get hung-up on the fact the evidence-base isn't perfect - NO - USE THE BEST AVAILABLE EVIDENCE

Care who is the driver of change - WHOEVER CAN DO IT RIGHT

Report SDs, levels of significance, error bars - IN GENERAL, NO

Discuss the variability or the exceptions to the rule - OF COURSE

Be OK with “ball parking” - WELCOME TO HEALTH CARE

Care if improved lab reporting improves patient outcomes - IT'S REALLY ABOUT DECISIONS AND THE “TRUTH”

Believe it is just the “other” lab's problem not ours - THAT'S ADORABLE

If I was the boss of “LAB” result reporting

All of this could be done today

Shift from a laboratory perspective to a patient-centered viewpoint

Using **BALLPARK** estimates

ALWAYS provide the imprecision

Provide MUCH more definitive guidance

Stop using terms like low, medium, high or significant

If they are “risk factor” measurements then they should only be provided with “risk” estimates

Do not do a test without discussion of a pre-test probability and then provide a post-test probability

Make many tests more “inconvenient”?

As much as
humanely possible

DO NOT use “flags”, adjectives, or mention SDs, Gaussian distributions, two-sided tests, Z-scores, T-scores, confidence intervals, or p-values.

Not sure if we even need point estimates

Ballpark RCVs

(means you have to see a change of this much to, by definition, rule out chance)

The magnitude of the imprecision around routinely ordered medical measurements*						
MEASUREMENT	Chloride Sodium Osmolality	Albumin Bone density Calcium Hematocrit Hemoglobin HbA1c INR MCH MCV Total protein Systolic BP	Creatinine Globulins Glucose Magnesium pCO2 Potassium PTT Total cholesterol T4	AST Alkaline phosphatase BUN HDL LDH LDL Phosphorous Platelets Rheumatoid factor Testosterone Uric acid WBC	GGT Neutrophils PSA Vitamin D	Aldosterone ALT Bilirubin Folate Iron Lactate Triglycerides TSH Vitamin B12
Approximate +/- range for a single measurement	~1-3%	~3-7%	~7-15%	~15-30%	~30-50%	~>50%
The magnitude of the change required between two serial measurements so one can be reasonably confident there has been a change**	~2-5%	~5-10%	~10-20%	~20-40%	~40-60%	~>60%

* based on the analytic and biologic variation

** also known as the reference change value

Data collated primarily from here - <https://www.westgard.com/biodatabase1.htm>
 but some also taken and confirmed from a few other sources - numbers rounded off for ease of use
 James McCormack BSc (Pharm), Pharm D - therapeuticseducation.org

	Statins (LDL)	BP meds (SBP)	Glucose meds (A1c)	Bone density meds (DEXA)
Typical changes seen with treatment	10-20 mg ~30% ↓ Inc dose to 40-80mg ~10% ↓	Initial dose 7-9mmHg (~5%) ↓ Increased dose 2-5 mmHg (~2-3%) ↓	0.7% A1c (~10%) ↓	5% ↑ over 3 years
Typical changes per year as one ages	~0.5-1% ↑	~0.5-8 mmHg ↑ (~0.5%)	~0.5% ↑	~0.5% ↓
Changes that need to occur to rule out chance	~10-20%	~5-10%	~5-10%	~3-5%*
